trazo

A prescription reader that is honest about what
it cannot read, with measured accuracy to prove it.

Trazo means pen stroke in Spanish.

The problem

This is a real prescription.

Doctor handwriting and short forms are hard to read.

A wrong dose or skipped medicine is a real risk.

Who it helps, and the gap

Who it helps

Patients and family members using a phone.

Caregivers managing medicines for elderly parents.

Not for doctors or pharmacists.

The gap

Most tools show confident output even when the reading is wrong.

Trazo shows what it could not read.

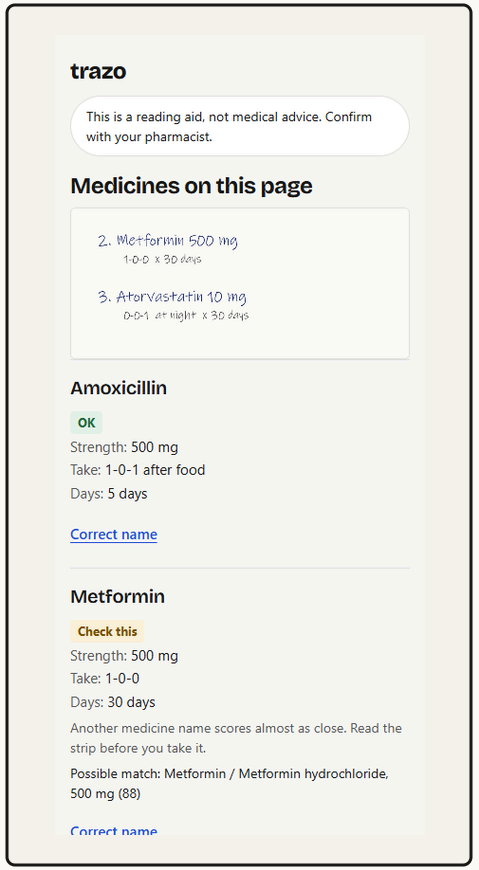

What Trazo does

Reads a prescription photo.

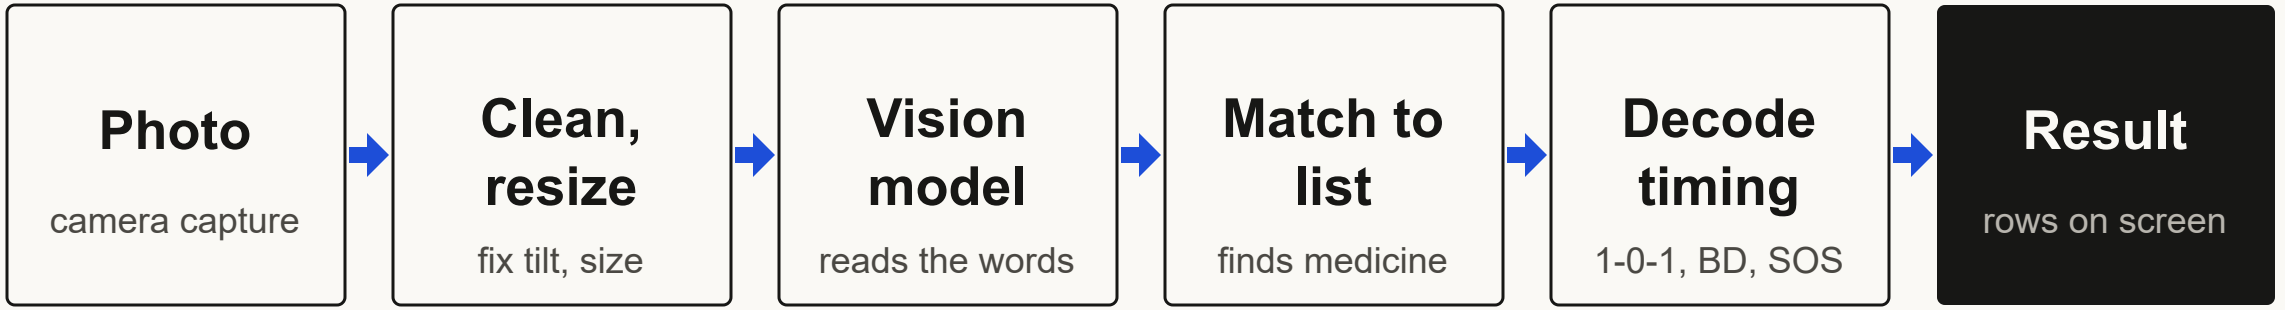

Shows medicine, strength, timing and duration.

Marks every unclear word instead of guessing.

> This is a reading aid, not medical advice.
> Confirm with your pharmacist.

How it works

OK | Check this | Unclear

The photo is processed in memory and deleted. It is not stored.

Tech stack

Part	Tool
Browser	HTML, CSS, JavaScript
Server	Python, FastAPI
Image handling	OpenCV, Pillow
Name matching	RapidFuzz
Storage	SQLite
Model	Ready-made vision model, via API

Free model API, no training. The accuracy work is in the rules, not the model.

Safety and privacy design

It never fills an unreadable word - it flags it instead.

Anything it cannot confirm becomes Check this or Unclear.

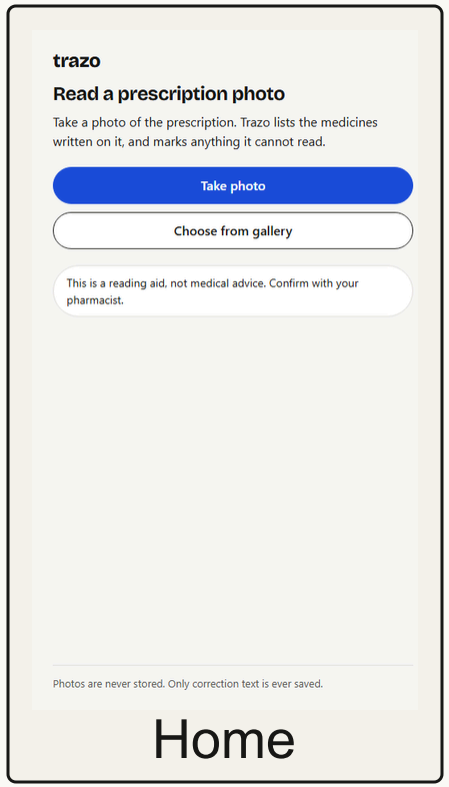

Warning on every result: a reading aid, not medical advice.

No photo is stored, ever.

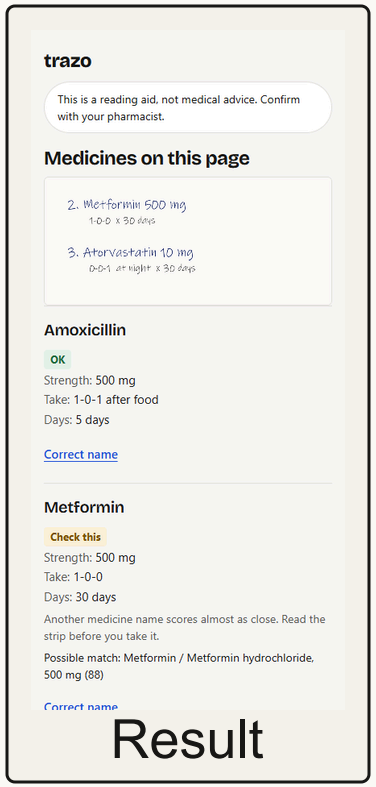

No dose advice or diagnosis.

Live demo

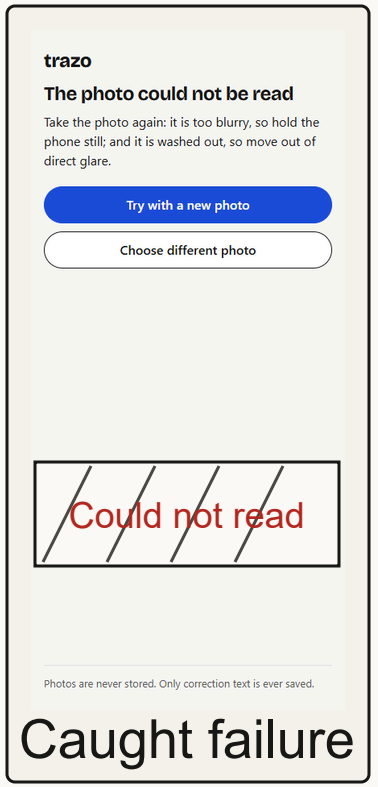

Live demo on a phone, using the camera.

Result

Caught failure

Limits

Medicine list covers only 94 medicines.

A name on the list is matched accurately; one off it stays Check this.

It reads what is written; it does not check doses.

The small list is the real limit - this is not a production system.

No clinical validation - a learning project.

Summary

Reads a prescription photo and lists each medicine.

Flags every word it cannot read - it never guesses.

Warns on every result: a reading aid, not medical advice.

Thank you.
